Advanced Applied Econometrics

Maximilian Blesch, Jonas Jessen, Peter Haan, Renke Schmacker, Hannes Ullrich, Felix Weinhardt

Spring Semester 2023

Course organization

- The course takes place on Fridays (in general), 9:00 - 12:00 at DIW Berlin (Room 2.3.020, Popper Room).

- All material can be found here: `https://github.com/hannesullrich/BSE_GC_AAE`

- PhD: Credit points: 9 ECTS

- Master: Credit points: 6 ECTS

- First session: April 21, 2023

- Final session: July, 14, 2023

- Exam: July, 21, 2023

- Compulsory reading in bold.

- PhD Evaluation: if this course is taken for credits, the final grade will be determined by

  - 3 problem sets (to be completed in groups of max. 2 participants), weighted 1/4 each,
  - a final exam, weighted 1/4.

- Master Evaluation: TBC

  - 2 problem sets out of 3 (to be completed in groups of max. 2 participants)
  - a final exam, weighted

Course objectives

- Discuss central methods and current advances in applied econometrics.

- Provide insights into empirical strategies (especially, identification) in important papers in the Labour, Public & IO literatures.

- Discuss in-depth a variety of econometric frameworks and their core assumptions for causal and counterfactual analysis. Give students an understanding of why and when adding structure informed by economic theory can be important.

- Establish basic estimation techniques & numerical methods such as simulation and numerical integration.

1 Introduction (April 21, PH)

- **Organization**

- **Methodology fights** Angrist and Pischke (2010), Frijters (2013), Halle (2022),Heckman (2010), Keane (2010), Rust (2010), Rust (2014), Wolpin (2013)

- **Basics discrete choice** van Soest (1995), Train (2009)

2 Omitted Variable Bias, Assessing Models, Fisher Inference, Stata (FW 28.4.)

In this session, we will cover different topics of general interest, before turning to more specific methods. These are (a) sometimes we are just left with the OLS. Can we learn anything from coefficient movements and the stability of our estimates when including or excluding more controls?, (b) in this course we will not talk about inference much but here is one powerful method for inference in experiments (that can also be applied in non-experimental settings) that works without distributional assumptions, its Fisher inference..., (c) for both topics we will use Stata, so this is being introduced alongside.

- Assessing endogeneity problems in OLS through coefficient movements

- Fisher inference

- Introduction to Stata software

6 Regression discontinuity (June 9 and 16, JJ)

- Introduction: Sharp and fuzzy RD

- Threats to identification and RD diagnostics (bunching, covariate distribution)

- Specification issues: choice of bandwidth, polynomial, control variables

- Regression kink design

- Geographic regression discontinuity

8   Static discrete choice with market-level data (June 30, HU)- This lecture will take place in Room 5.2.010

- Recap Berry et al. (1995).

- Coding exercise: Berry et al. (1995) nested fixed-point (NFP) algorithm.

- Discuss extensions and alternative estimation methods.
